

Simply: Without “A” chromosome, there is no gene. Without a gene, there is no protein. Every suggestion the “phenotype” scorecard is not *manufactured* is NONSENSE.

Phenotype:

In genetics, the phenotype (from Ancient Greek φαίνω 'to appear, show, shine', and τύπος 'mark, type') is the set of observable characteristics or traits of an organism. The term covers the organism's morphology or physical form and structure, its **developmental processes**, its biochemical and physiological properties, its behavior, and the products of behavior.

Wikipedia [emphasis mine]

“A” chromosome is yeast cultured in feces bacteria.

“inter species FRAUD”

alchetron.com/Aphanizomenon-flos-aquae

CDC SCUBA TEAM

www.infectiousdiseasetoday.com/view/cdc-provides-update-multistate-outbreak-e-coli-o157h7-infections

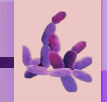

- ROBS OXYGEN FROM HUMAN LUNGS
- Partial list of clones
- Gas vesicles in *E. coli* protein coated... [manufactured]
 - Gas vesicles in *E. coli* hollow organelles...
 - Gas vesicles in *E. coli* found in cyanobacteria At left and halophilic archaea At right (SLOTH, p. 2450)."
 - Gas vesicles in *E. coli* The only known physiological role... gas vesicles... position themselves in liquid for optimal light and oxygen... (DISCUSSION, SLOTH, p. 2457)
 - Gas vesicles in *E. coli* The “Root Effect” follows. It describes how Oxygen is Robbed in red blood cells.

THESE ARE MY LUNGS

Rhodopsin, also called visual purple, pigment-containing sensory protein that **converts light into an electrical signal** www.quora.com/How-does-rhodopsin-work

Without a chromosome: no “A” gene. Without “A” gene: no protein. This is a test tube. It is not a chromosome. It is not a gene. *E. coli* is not liquid, *Bacillus Megaterium* is not liquid. This Obscenity kills the host for Oxygen.

This is ancient salt:
Below, left

Halobacterium Salinarum

The list above is the number of attempts until the CDC SCUBA team began to breathe on its own, cloned with soil bacilli, then HALO salt

“Halobacterium Salinarum are capable of growing in aerobic and anaerobic conditions. Gas vesicles formation aid in aerobic conditions, as gas vesicles aid in flotation to surface water where oxygen is more readily available. When grown in anaerobic (p. 1) conditions, Halobacterium salinarum also carries an advantage as it posses[sic] bacteriorhodopsin that allow for it to grow in anaerobic conditions in light conditions, (p. 2)... Halobacterium salinarum posses 4 retinal proteins; bacteriorhodopsin, halorhodopsin and two sensory rhodopsins [sic] Bacteriorhodopsin gives this specie its purple pigmentation with a light-driven proton pump that aid in photosynthesis and is found in patches called purple membrane within the cell membrane. Halorhodopsin gives it a light driven chloride pump and the sensory rhodopsins are involved in the sensitivity of light used in Phototaxis [DNA cellular penetrations initiated by visible light EMF cellular microwave radiations (p. 2)]. All pgs. NASA Fraud, 1976-7

Please visit the FB page, “Slappingtons” and read the post pinned at top.

The bacillus phenotypes latch on; deny the host oxygen. A Halo bacillus was discovered yesterday. It remains alive after 350 million years. “... phenotype[s] ... changes in the environment ... oxygen, salt concentration and light exposure... expression of various genes... dictate pigment (Halo POX, p. 4).”

Fair Use Doctrine applies The criminals orchestrating this violence, first assaulted my family. The CDC is not a “bank” either. It is a secret society established in 1816.

NASA is involved in the “Halobacterium” Fraud.
